Sequence 5, Application US/09335948

Patent No. 6329198

GENERAL INFORMATION:

APPLICANT: National Institutes of Health

APPLICANT: Charles R. King

APPLICANT: Dance A. Liotta

TITLE OF INVENTION: PRODUCTION AND USE OF HUMAN NM23 PROTEIN

TITLE OF INVENTION: AND ANTIBODIES THEREFOR

TITLE OF INVENTION: AND ANTIBODIES THEREFOR

FILE REFERENCE: 14014.0321

CURRENT APPLICATION NUMBER: US/09/335,948

CURRENT FILING DATE: 1999-06-18

PRIOR FILING DATE: 1995-06-07

PRIOR PILING DATE: 1995-06-07

PRIOR FILING DATE: 1991-12-11

PRIOR PILING DATE: 1999-10-18

Sequence 5, Application US/09335948

Patent No. 6329198

GENERAL INFORMATION:

APPLICANT: National Institutes of Health
APPLICANT: Charles R. King
APPLICANT: Lance A. Liotta

TITLE OF INVENTION: PRODUCTION AND USE OF HUMAN NM23 PROTEIN

TITLE OF INVENTION: AND ANTIBODIES THEREFOR

FILE REFERENCE: 14014.0321

CURRENT APPLICATION NUMBER: US/09/335,948

CURRENT PILING DATE: 1999-06-18

PRIOR APPLICATION NUMBER: 08/475,634

PRIOR FILING DATE: 1995-06-07

PRIOR FILING DATE: 1991-12-11

PRIOR FILING DATE: 1991-12-11

PRIOR FILING DATE: 1999-10-18

NUMBER OF SEQ ID NOS: 6

SOUTHWENT APPLICATION NUMBER: 07/422,801

PRIOR FILING DATE: 1989-10-18

NUMBER OF SEQ ID NOS: 6

SOUTHWENT APPLICATION NUMBER: 07/422,801

PRIOR FILING DATE: 1989-10-18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            184
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CIQVGRNIIHGSDSVKSAEKEISLWFQPEELVEYKSCAQNWIYE 166

DISEASE: This protein is found in reduced amount high metastasic potential.
SIMILARITY: Belongs to the NDK family.
                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                       1- FUNCTION: Acts as a transcriptional activator of binds DNA nonspecifically (Ref.3).
1- CATALYTIC ACTIVITY: ATP + nucleoside diphosphate nucleoside triphosphate.
1- COFACTOR: Magnesium (By similarity).
1- SUBUNIT: Hexamer of two different chains: A and 3 A3B3, A2B4, AB5, B6).
1- SUBCELLULAR LOCATION: Nuclear and cytoplasmic.
1- PTM: The N-terminus is blocked.
                                                                                                                                                                                                                                                                                                                                                                         diphosphate

TISSUE=Brain;

NIH - Mammalian Gene Collection (MGC) project;

Submitted (NOV-2004) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Major role in the synthesis of nucleoside triphosphate other than ATP. The ATP gamma phosphate is transferred to the beta phosphate via a ping-pong mechanism, using a phosphorylate active-site intermediate.

-!- CATALYTIC ACTIVITY: ATP + nucleoside diphosphate = ADP + nucleoside triphosphate.

-!- CATALYTIC ACTIVITY: ATP + nucleoside diphosphate = ADP + nucleoside triphosphate.

-!- COFACTOR: Magnesium (By similarity).

-!- SUBCELLULAR LOCATION: Cytoplasmic and plasma membrane.

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).

-!- FUNCTION: Major role in the synthesis of nucleoside triphosphates other than ATP. The ATP gamma phosphate is transferred to the NDP beta phosphate via a ping-pong mechanism, using a phosphorylated active-site intermediate.

-!- CATALYTIC ACTIVITY: ATP + nucleoside diphosphate = ADP + nucleoside triphosphate.

-!- COFACTOR: Magnesium (By similarity).

-!- COFACTOR: ASS, BS, BS).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            e C.,

"Characterization and cloning of a nucleoside-diphosphate kinase

T argeted to matrix of mitochondria in pigeon.";

J. Biol. Chem. 272:24604-24611(1997).

C -!- FUNCTION: Major role in the synthesis of nucleoside triphosphates other than ATP. The ATP gamma phosphate is transferred to the NDP beta phosphate via a ping-pong mechanism, using a phosphorylated active-site intermediate.

C -!- CATALYTIC ACTIVITY: ATP + nucleoside diphosphate = ADP + nucleoside triphosphate.

C -!- CATALYTIC ACTIVITY: ATP + nucleoside diphosphate = ADP + nucleoside triphosphate.

C -!- COFACTOR: Magnesium (By similarity).

C -!- SUBCELLULAR LOCATION: Cytoplasmic and plasma membrane.

C -!- SUBCELLULAR LOCATION: Cytoplasmic and plasma membrane.

C -!- SUBCELLULAR LOCATION: Cytoplasmic and blasma membrane.

C -!- SIMILARITY: Belongs to the NDK family.

J. Biol. Chem. 268:2583-2589(1993).

-!- FUNCTION: Major role in the synthesis of nucleoside triphosy other than ATP. The ATP gamma phosphate is transferred to the phosphate via a ping-pong mechanism, using a phosphorylactive-site intermediate.

-!- CATALYTIC ACTIVITY: ATP + nucleoside diphosphate = ADP + nucleoside triphosphate.

-!- CATALYTIC ACTIVITY: ATP + nucleoside diphosphate = ADP + nucleoside triphosphate.

-!- COFACTOR: Magnesium (By similarity).

-!- SUBUNIT: Hexamer of two different chains: A and B (A6, A5B, A3B3, A2B4, AB5, B6). Interacts with SET (By similarity).

-!- SUBCELLULAR LOCATION: Nuclear and cytoplasmic.

-!- DISEASE: This protein is found in reduced amount in tumor of high metastasic potential.

-!- SIMILARITY: Belongs to the NDK family.
                                                                                                                                                                            ø
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A5B

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).

-!- FUNCTION: Major role in the synthesis of nucleoside triphosy other than ATP. The ATP gamma phosphate is transferred to the beta phosphate via a ping-pong mechanism, using a phosphoryly active-site intermediate.

-!- CATALYTIC ACTIVITY: ATP + nucleoside diphosphate = ADP + nucleoside triphosphate.

-!- CATALYTIC ACTIVITY: ATP + nucleoside diphosphate = ADP + nucleoside triphosphate.

-!- COFACTOR: Magnesium (By similarity).

-!- SUBUNIT: Hexamer of two different chains: A and B (A6, A5B, A3B3, A2B4, AB5, B6). Interacts with SET (By similarity).

-!- SUBCELLULAR LOCATION: Nuclear and cytoplasmic.

-!- DISEASE: This protein is found in reduced amount in tumor of high metastasic potential.

-!- SIMILARITY: Belongs to the NDK family.

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903 (2002).

-!- FUNCTION: Major role in the synthesis of nucleoside triphosphates other than ATP. The ATP gamma phosphate is transferred to the NDP beta phosphate via a ping-pong mechanism, using a phosphorylated extive-site intermediate.

-!- CATALYTIC ACTIVITY: ATP + nucleoside diphosphate = ADP + nucleoside triphosphate.

-!- COFACTOR: Magnesium (By similarity).

-!- SUBUNIT: Hexamer of two different chains: A and B (A6, A5B, A4B2, A3B3, A2B4, AB5, B6). Interacts with SET (By similarity).

-!- SUBCELLULAR LOCATION: Nuclear and cytoplasmic.

-!- SUBCELLULAR beto protein is found in reduced amount in tumor cells of high metastasic potential.

-!- SIMILARITY: Belongs to the NDK family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            of

The ATP gamma phosphate is transferred to the NDP beta phosphate via a ping-pong mechanism, using a phosphorylated active-site intermediate.

CATALYTIC ACTIVITY: ATP + nucleoside diphosphate = ADP +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       OPAVKPCHLKGTMANSERTFIAIKPDGVQRGLVGEIIKRFEQKGFRLVGLKFLQASEDLL

NIH MGC Project;
Submitted (APR-2002) to the EMBL/GenBank/DDBJ databases.

-!- CATALYTIC ACTIVITY: ATP + nucleoside.diphosphate = ADP +
nucleoside triphosphate.

-!- SIMILARITY: Belongs to the NDK family.

                                                                                                                                                                                                                           other than ATP.

-1- CATALYTIC ACTIVITY: ATP + nucleoside diphosphate = ADP +
nucleoside triphosphate.
-1- COFACTOR: Magnesium.
-1- COFACTOR: Magnesium.
-1- SUBUNIT: Hexamer of two different chains: A and B (A6, A5B, A4B2, A3B3, A2B4, AB5, B6). Interacts with SET.
-1- SUBCELLULAR LOCATION: Nuclear and cytoplasmic.
-1- TISSUE SPECIFICITY: Expressed in lung carcinoma cell lines but not in normal lung tissues.
-1- FTM: The N-terminus is blocked.
-1- DISEASE: This protein is found in reduced amount in tumor cells of high metastasic potential. Somatic mutations of NME1 are found in neuroblastoma. Increased NME1 in neuroblastoma is correlated with features of the disease that are associated with aggressive tumors. May therefore have distinct if not opposite roles in
                                                                                                                                                                                                                                                                                                                                                             ut not

COFACTOR: Magnesium (By similarity).

SUBUNIT: Hexamer of two different chains: A and B (A6, A5B, A A3B3, A2B4, AB5, B6). Interacts with SET (By similarity).

SUBCELLULAR LOCATION: Nuclear and cytoplasmic (By similarity).

SIMILARITY: Belongs to the NDK family.
                                                                                                                                                                          Takahashi M., Une R., Fukushima K., Fujiki M., Misumi K., Miyosh Endo Y., Oishi A., Akuzawa M.;

"Molecular cloning of canine nm23 cDNAs and their expression in and tumor tisuues.";

Submitted (MAR-2005) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Major role in the synthesis of nucleoside triphosp other than ATP (By similarity).

-!- CATALYTIC ACTIVITY: ATP + nucleoside diphosphate = ADP +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         intermediate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SMAKT; SMUOS62; NDK; 1.

Sequence 5, Application US/09335948

Patent NO. 6229198

GENERAL INFORMATION:

APPLICANT: National Institutes of Health
APPLICANT: Charles R. King

APPLICANT: Patricia S. Steeg

APPLICANT: Lance A. Liotta

TITLE OF INVENTION: PRODUCTION AND USE OF HUMAN NM23 PROTEIN

TITLE OF INVENTION: AND ANTIBODIES THEREFOR

TITLE OF INVENTION: AND ANTIBODIES THEREFOR

FILE REFERENCE: 14014.0321

CURRENT APPLICATION NUMBER: US/09/335,948

CURRENT PILING DATE: 1999-06-18

PRIOR FILING DATE: 1995-06-07

PRIOR PILING DATE: 1991-12-11

PRIOR PILING DATE: 1991-12-11

PRIOR PILING DATE: 1999-10-18

NUMBER OF SEQ ID NOS: 6

SECOTOR NOTE: NUMBER: OT/422,801
